

DS1834/A/D Dual EconoReset with Pushbutton

FEATURES

- 5 volt power-on reset
- 3.3 volt power-on reset
- Internal power is drawn from higher of either the 5V IN input or the 3.3V IN input
- Excellent for systems designed to operate with dual power supplies
- · Asserts resets during power transients
- Pushbutton reset input for system override
- Maintains reset for 350 ms after V_{CC} returns to an intolerance condition
- Reduces need for discrete components
- Precision temperature–compensated voltage reference and voltage sensor
- 8-pin DIP, 8-pin SOIC, and 8-pin μ-SOP available
- CMOS output for low current operation on the DS1834 and DS1834D
- Operating temperature of -40°C to +85°C

PIN ASSIGNMENT

PIN DESCRIPTION

5V_{IN} – 5V Power Supply Input 5V RST(*RST) – 5V Reset Output

5V TOL - Selects 5V Input Tolerance

GND - Ground

PBRST – Pushbutton Reset

3.3V TOL - Selects 3.3V Input Tolerance

3.3V RST(*RST) - 3.3V Reset Output 3.3V_{IN} - 3.3V Power Supply Input

*DS1834D Active High Reset

DESCRIPTION

The DS1834 Dual EconoResets monitors three vital system conditions: 5 volt supply, 3.3 volt supply, and an external override. First a precision temperature reference and comparator circuit monitors the status of the 5 volt supply and the 3.3 volt supply. When an out–of–tolerance condition is detected, an internal power fail

signal is generated which forces the reset of the affected supply to an active state.

Lastly, the DS1834 supports an external reset via an internally debounced pushbutton input. When the pushbutton is pulled low both resets will be asserted for approximately 350 ms after the pushbutton is released.

OPERATION

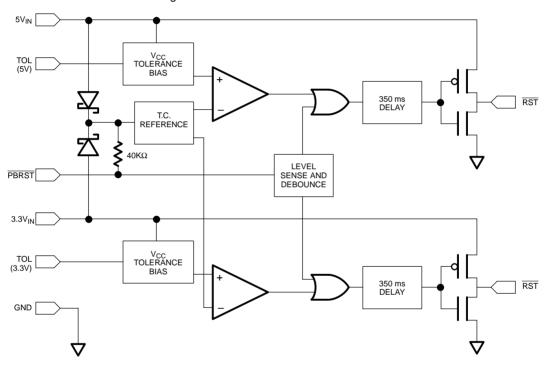

Power Monitor

The DS1834 provides the functions of detecting out–of–tolerance conditions on a 3.3 volt and 5 volt power supply and warning a processor based system of impending power failure. When an input is detected as out–of–tolerance on either voltage input the RST for that supply will be forced active. When that input returns to a valid state the RST will remain active for about 350 ms and then return to an inactive state until the next input out–of–tolerance condition.

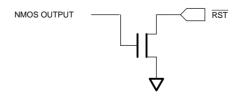

On power–up both resets are kept active for approximately 350 ms after the power supply inputs have reached the selected tolerance. This allows the power supply and system power to stabilize before RST is released.

All internal operating current for the DS1834 will be drawn from the input with the highest voltage level. The outputs will draw current only from the controlling input (5V IN or 3.3V IN).

Tolerance Select

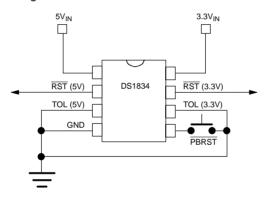

The DS1834 provides two TOL inputs for individual customization of the DS1834 to specific application requirements. If the TOL for the 5 volt supply is tied to the 5 volt input a 10% tolerance is selected for the 5 volt supply. If the TOL for the 3.3 volt supply is tied to the 3.3 volt input a 20% tolerance is selected for the 3.3 volt supply. If TOL inputs are tied to ground the 5 volt input will be set at a 5% tolerance and the 3.3 volt input would be set to a 10% tolerance.

are not in a reset cycle, a pushbutton reset can be generated by pulling the \overline{PBRST} pin low for at least 2 ms. When the pushbutton is held low, both resets are forced active and will remain active for about 350 ms after the pushbutton is released. The pushbutton input is pulled high through an internal 40K Ω pull–up resistor and debounced via internal circuitry. See Figure 3 for an application example and Figure 4 for the timing diagram.

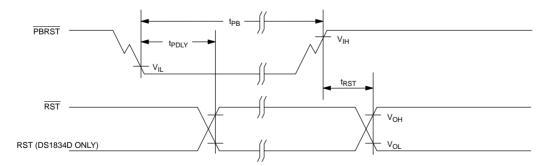

Pushbutton Reset

The DS1834 provides a pushbutton switch for manual reset control. When at least one of the DS1834 resets

OUTPUT VALID CONDITIONS

All versions of the DS1834 can maintain valid outputs as long as one input remains above 1.2 volts. However, the RST outputs on the DS1834 use a push–pull output structure which can maintain a valid output below 1.2 volts. To sink current below 1.2 volts a resistor can be connected from RST to GND (see Figure 5). This arrangement will maintain a valid value on the RST outputs even if all inputs are at 0 volts. During both power–up and power–down this arrangement will draw

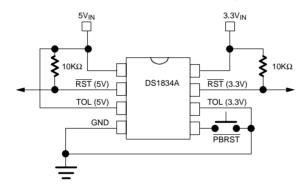

current when \overline{RST} is in the high state. A value of about 100K $\!\Omega$ should be adequate to maintain a valid condition.

The DS1834A requires pull—up resistors on the outputs to maintain a valid output. The value of the resistors is not critical in most cases but must be set low enough to pull the output to a high state. A common value used is $10 \mathrm{K}\Omega s$ (see Figure 6 and Figure 7).

NOTES:

- 1. All voltages are referenced to ground.
- 2. Measured with both 3.3V_{IN} and 5V_{IN} ≥2.7V.
- 3. Measured with both 3.3V_{IN} and 5V_{IN} ≤2.7V.
- 4. \overline{PBRST} is internally pulled up to $V_{IN(MAX)}$ input with an internal impedance of approximately $40K\Omega$.
- 5. Measured with either $3.3V_{IN}$ or $5V_{IN} \ge 2.7V$ (valid for DS1834 and DS1834D only).
- 6. Measured with outputs open and both 3.3V_{IN} and 5V_{IN} ≤5.5V.
- 7. Measured with outputs open and both $3.3V_{IN}$ and $5V_{IN} \le 3.6V$.
- 8. Noise immunity pulses < 2 μs @ V_{CCTP} minimum will not generate a reset.
- 9. $t_R=5 \mu s$.
